(b) Ans: - This is a process where solder a fusible metal alloy typically a wire is heated to a high temperature with the tip of the soldering iron. when this solder cools and hardens, it acts in much the same way as glue.

(c) Ans: - Diode  $\Rightarrow$  Diodes are made from a semiconductor, most of them silicon but sometimes germanium. It allows current to flow easily in one direction, but severely restricts current flowing in the opposite direction.

(d) Ans: - Transistor  $\Rightarrow$  A transistor is a type of semiconductor device that can be used to conduct and insulate electric current or voltage. A transistor basically act as a switch and an amplifier.

Ques 1  
(a) Resistor :-

Resistor may be defined as a device that does not allow current to flow through it freely in a circuit, this is known as "resistor"

(b) Soldering irons heat the solder, causing the alloy to melt, which then seals and joins two pieces of metals to each other when this solder seals and hardens, it acts in much the same way as glue

(c) A diode is a semiconductor device that essentially acts as a one way switch for current. It allows current to flow easily in one direction, but severely restricts current from flowing in the opposite direction.

(d) Transistor :-  
A transistor is a semiconductor device used to amplify and switch electrical
